Description

It is a digital time domain reflectometer used for finding the distance to the fault from one end of the cable (Pre-Location).

Pulse Echo Method

Low voltage pulses are injected into the cable to locate open or short circuit low resistive faults up to 200 ohm (measured by multimeter) only. Provides total length of the cable.

Impulse Current Method (ICM)

High voltage surges with the help of surge generator are injected into the power cables. It gives the fault distance of almost all types of faults including low resistive, high resistive and intermittent faults.

Decay Method

Decay method is most suitable for accurate pre-location of Flashing faults.

Interactive Software

The interactive menu based graphical user interface makes it easy for even a layman to pre-locate the fault distance. The software automatically saves all the test results for future review and analysis with a huge storage capacity of more than 100,000 graphs.
